100 questions you can ask

A practical question bank for the dataset-based website

Use these exact questions in Chat Assistant, click them in the searchable question bank, or enter their IDs: Q1 through Q100. Answers use the selected historical record, analysis window and anomaly threshold.

How to use it

1. Start the project and open Chat Assistant.
2. Open Question bank and search or choose a category.
3. Select a question or type its number.
4. Pause playback when comparing answers for the same record.
5. Use Export chat to save the conversation.

What kind of assistant is this?

An offline assistant with supported questions and dataset calculations. It is not an external generative language model. Questions about unavailable measurements receive an explanation rather than invented values.

001-010	Dataset and source
011-020	Selected record
021-030	Window energy analysis
031-040	Forecasts and uncertainty
041-050	Model quality and training
051-060	Anomalies and alerts
061-070	Risk and energy exposure
071-080	Playback and navigation
081-090	Exports and running the project
091-100	Limitations and interpretation

Historical observations and model estimates retain their original timestamps. No current-day readings, perfect predictions or equipment-failure diagnosis are promised.

Dataset and source

001 Which dataset does this website use?

002 Is this dataset generated by ChatGPT?

003 Is our current dataset from Kaggle?

004 Where can I download the official dataset?

005 Which CSV file is used for training?

006 Which household is selected?

007 What is the time resolution?

008 What period is displayed by this website?

009 How many measured intervals and test records are included?

010 What attribution should I use in my report?

Selected record

011 What is the selected record time?

012 What is solar generation at the selected hour?

013 What is consumption at the selected hour?

014 How much power is imported at the selected hour?

015 How much power is exported at the selected hour?

016 What is the net grid power?

017 Is solar covering the selected load?

018 What is the solar surplus at this record?

019 What is the solar deficit at this record?

020 What is the solar forecast error at this record?

Window energy analysis

021 Summarize the selected energy window.

022 How much solar energy is in this window?

023 How much load energy is in this window?

024 What is the imported energy total?

025 What is the exported energy total?

026 What percentage of load is covered by solar?

027 What is the peak solar generation in this window?

028 What is the peak load in this window?

029 What is the average solar power in the window?

030 What is the average load power in the window?

Forecasts and uncertainty

031 What is the next-hour forecast?

032 What is the next-hour solar prediction?

033 What is the next-hour load prediction?

034 When was the next-hour prediction issued?

035 What does one-hour-ahead prediction mean?

036 What is the solar prediction interval?

037 What is the load prediction interval?

038 Are prediction intervals guaranteed?

039 Why is a next-hour forecast unavailable?

040 Are these forecasts for today?

Model quality and training

041 Which models were selected?

042 What is the solar test MAE?

043 What is the load test MAE?

044 What are the test RMSE values?

045 How do the models compare with persistence?

046 How was the dataset split for training?

047 Which features are used by the models?

048 Why is load RMSE large?

049 What is the solar MAE in the current window?

050 What is the load MAE in the current window?

Anomalies and alerts

051 How many solar deviations are flagged?

052 What is the largest solar error in this window?

053 What is the current anomaly threshold?

054 Is the selected record flagged?

055 What percentage of selected records is flagged?

056 Does an anomaly mean equipment has failed?

057 How do I mark an alert reviewed?

058 How do I undo a reviewed alert?

059 Why do alert counts change during playback?

060 Are alerts live notifications?

Risk and energy exposure

061 What is the selected energy exposure score?

062 What is the selected grid dependence?

063 How is the exposure score calculated?

064 Where do the risk weights come from?

065 What are the low, moderate and high bands?

066 Is the risk score a probability of failure?

067 Why can the score be high at night?

068 What happens when load is zero?

069 How does changing the threshold affect the score?

070 Can this score predict future faults?

Playback and navigation

071 What is historical playback for?

072 How do I start or pause playback?

073 How do I change playback speed?

074 How do I jump to a recorded date?

075 How do I change the analysis window?

076 Does playback retrain the AI model?

077 How do I open or close the sliding menu?

078 How do I enable dark mode?

079 What happens at the end of playback?

080 How do I compare predictions with actual values?

Exports and running the project

081 How do I export the selected records?

082 How do I download the analysis report?

083 How do I export the whole test dataset?

084 How do I start the website in VS Code?

085 What should I do if port 8000 is busy?

086 Do I need to install Node to view the website?

087 Where are the saved predictions stored?

088 How do I retrain using the original CSV?

089 How do I download this chat conversation?

090 Where can I find all 100 supported questions?

Limitations and interpretation

091 Do I need physical sensors for this website?

092 Can you show battery state of charge?

093 Can you show temperature or irradiance?

094 Can you show voltage and current?

095 Are readings instantaneous or hourly averages?

096 What is the difference between kW and kWh?

097 Why are some times missing from the charts?

098 Can this website control a battery or grid switch?

099 Does the chatbot use ChatGPT or an external LLM?

100 Can you guarantee perfect predictions?
